

For your setup (**Spring Boot + PostgreSQL + JPA + ddl-auto=update**), here is the complete flow from database creation to viewing rows.

1. Open PostgreSQL

```
psql -U postgres
```

Enter password.

2. Create database

```
CREATE DATABASE tododb;
```

3. Verify database created

```
\l
```

Output example:

```
postgres
template0
template1
tododb
```

4. Connect to database

```
\c tododb
```

Output:

```
You are now connected to database "tododb"
tododb=#
```

5. Run Spring Boot application

Because of:

```
spring.jpa.hibernate.ddl-auto=update
```

and:

```
@Entity
public class Todo {
    @Id
    @GeneratedValue
```

```
    Long id;
    String title;
    String description;
    Boolean isCompleted;
}
```

Spring automatically creates:

todo table

(No manual SQL table creation needed)

6. List all tables created by JPA

```
\dt
```

Output example:

```
public | todo
```

7. See table structure

```
\d todo
```

Output example:

Column	Type
id	bigint
title	varchar
description	varchar
is_completed	boolean

8. View all rows in table

```
SELECT * FROM todo;
```

Output example:

id	title	description	is_completed
1	Todo1	Spring Boot	true

9. Exit PostgreSQL

\q

That's the full PostgreSQL + Spring JPA workflow you'll repeatedly use.
